

OPERATIONS ANALYTICS PORTFOLIO

Live Container Operations Performance Dashboard

An anonymised case study showing how fragmented work records were converted into a structured operational dataset and management dashboard.

391	7	S\$75,720	1
CONTAINER JOBS	REPORTING PERIODS	RECORDED REVENUE	DOCUMENTED AMENDMENT

The challenge

Operational records existed across fortnightly work-detail sheets, amendments and invoices. The information was usable for billing, but not organised for performance analysis, trend review or consistent management reporting.

Objective Create a reliable, traceable foundation for analysing work volume, container and SKU complexity, service amendments and revenue.	Method Standardise the records, reconcile totals, classify services and build a formula-driven Excel dashboard with a source register and data-quality checks.
--	--

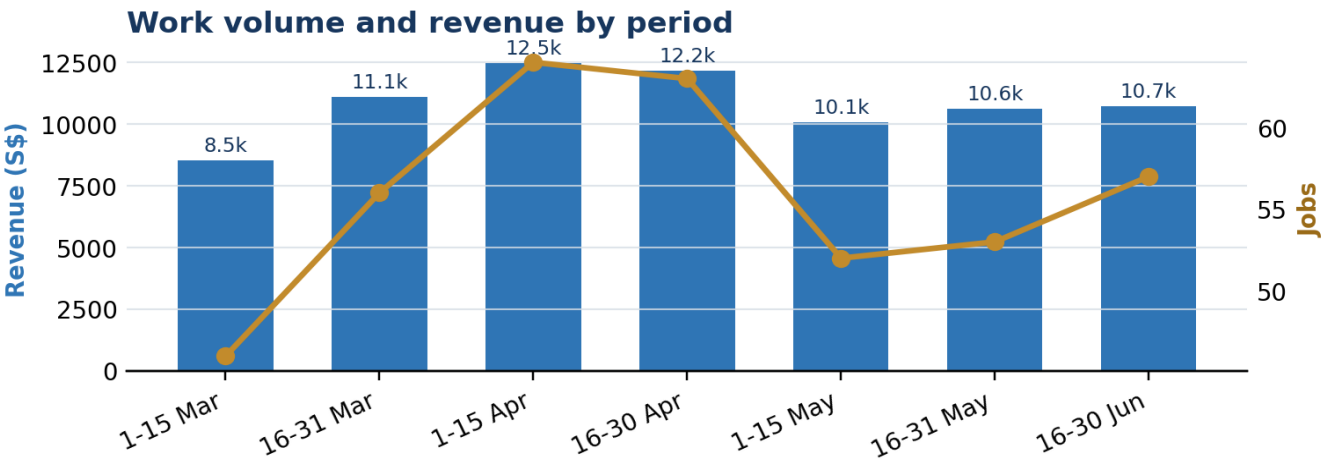

Figure 1. Aggregate period performance. No customer, container, bank or contact details are shown.

What the analysis shows

Verified operational evidence

The dashboard makes the operation measurable while keeping the underlying commercial records private.

1. Volume and revenue pattern

Across the seven supplied periods, the records show 391 container jobs and S\$75,720 in revenue, equivalent to S\$193.66 revenue per recorded job. The highest recorded period was 1-15 April, with 64 jobs and S\$12,474 revenue.

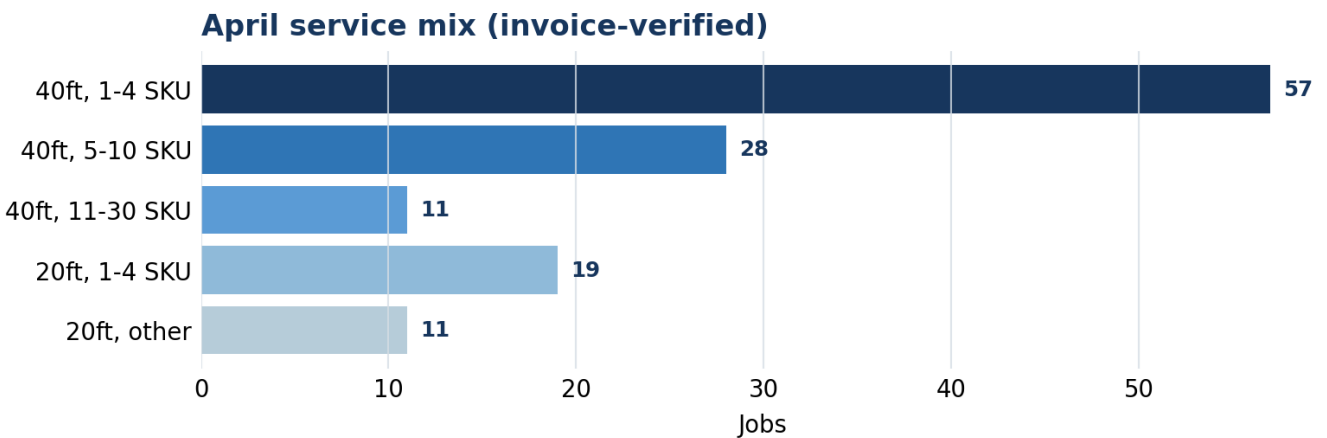

Figure 2. April mix based on invoice-verified service categories. Pallet replacement is excluded from the job bars and recorded separately as 23 units and S\$184 revenue.

DATA QUALITY	SERVICE MIX	MANAGEMENT USE
A March amendment corrected one SKU classification from 11 to 10 and revised the period total from S\$8,580 to S\$8,530. This demonstrates the need for controlled corrections and reconciliation.	April invoices show 57 low-complexity 40ft jobs, 28 medium-complexity 40ft jobs and 11 higher-complexity 40ft jobs, alongside 20ft work and pallet replacement.	The structure supports regular review of demand mix, revenue movement, data exceptions and future workforce-performance measures.

Deliverables

- An anonymised operational dataset with standardised periods, job types and revenue fields
- A formula-driven Excel dashboard for period, service-mix and amendment review
- A source register and reconciliation logic to preserve traceability
- A data-capture framework for the next measurement phase

Next measurement phase

The current records do not prove turnaround time, labour productivity, waiting time, cost savings or job profitability. Measuring these responsibly requires planned and actual start/end times, worker count, labour hours and cost, delay reasons and rework data.

Privacy: customer, container, address, contact, bank and source-file details have been removed.
